## General Internal Medicine Inpatient Deceased Note

*Encounter dates:* Admitted 01 Aug 2019; Deceased 16 Aug 21 12:02 (746 hospital days)  
*Primary care provider:* Aidevo Sandra Adebo  
*Attending provider:* Fraser W. Armstrong  
*Goals of care:* GCD-M1 (Source: Patient;Alternate Decision Maker; Clarification: Family conference outcome)

### Overview

This 82 y.o. year old man was brought from home (family care) to the EDM WMC University of Alberta Hospital because of 1 week worsening exertional dyspnea, was admitted for respiratory support, and passed away in facility due to cardiopulmonary arrest in the setting of hypercapnic respiratory failure complicating exacerbations of both lung and heart failure.

### Most Responsible Encounter Diagnosis

Respiratory failure with hypoxia

### Preliminary Cause of Death

(HFpEF) heart failure with preserved ejection fraction

### Hospital Problems

Principal Problem:

Respiratory failure with hypoxia

Active Problems:

Type 2 diabetes mellitus

CKD (chronic kidney disease)

COPD (chronic obstructive pulmonary disease)

HFpEF (heart failure with reduced ejection fraction)

Hypertension

GERD (gastroesophageal reflux disease)

Resolved Problems:

Stroke

Diabetes mellitus

### Hospital Course

- This 82 y.o. man was brought from home (family care) to the EDM WMC University of Alberta Hospital because of 1 week worsening exertional dyspnea and was admitted for respiratory support. Key hospital milestones include:

- Stabilized with fluid, electrolyte and glucose management (brief ketoacidosis), coupled with short term speculative antibiotics
- Recovered baseline organ function within 48 hours while mild delirium cleared within 72 hours
- Remainder of hospitalization focused on re-calibration of medications and reactivation for deconditioning
- Despite best efforts, breakthrough acute left and right heart failure persisted, with patient and family resolve to not seek ventilatory support.
- An unwitnessed cardiopulmonary arrest led to death in hospital discovered on patient vitals rounds by nursing. Resuscitation was not attempted.

### Interventions

No clinically significant procedural interventions occurred during this admission.
